

Trouser Measure/Mark/Cut Station

Americas 21st has advanced the cutting of trousers, pants and jeans with a semi-automated device for easily and accurately measuring, marking and cutting inseam lengths, including the added measure for roll-up. In operation, the team member sets the required

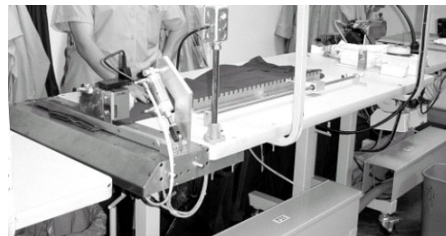

inseam length measure (with added-roll-up dimension),

loads the garment, and pushes a button. Immediately, a clamp lowers to both hold the garment

and prevent access to the blade for safety. An industrial-grade rotary knife then activates and smoothly cuts through both legs – even through multi-layer jeans' felled seams.

When the button is released the knife returns to home position, the

clamp raises, and the cut-off waste falls into an adjacent bin. The table includes a crank mechanism to adjust table height for comfort and safety, four lockable casters, and a fluorescent work light, making this a complete stand alone work station. The process speeds the cutting of garments to accurate leg lengths with a clean finished edge for separate hemming. Hooks on the table front ease hanging of finished garments, or an optional shelf can be added for work on folded units. A less-costly unit with a manual control of the knife is available for lower volume operations, otherwise providing all other productive features. Both products can be used alone or with Americas 21st's other production stations for hemming/pressing trousers, sewing of emblems, attachment of ID tapes, etc.
